

Cattle feed from cashew apple waste

Cashew apple waste is a menace in processing industries. This waste can be used as a promising feed source in dairy and piggery units. After juice extraction for human consumption, the cellulose rich processing unit residue (pomace) can be used as a nutrient rich poultry and cattle feed in wet or dry format. Because of the high dry matter (22.5%) and protein content (13.7%) and low content of crude protein (11.8%) in cashew apple, it can be ensiled as a potential poultry or cattle feed.
